

Recent Improvements to the iOS App

Background

- The iOS app version of Collabora Office has existed for several years
- Based on including suitable parts of Collabora Office core code (C++), Collabora Online server code (C++), and Collabora Online client code (JavaScript) in the same app

No iOS-specific Functionality Changes in the Last Year

- But most improvements to Online UI in general, and most of the improvements to core that aren't UI related, apply to the iOS app, too
- Other lightning talks describe those

Build Fixes

- For a while the master branch of Online was not buildable as the iOS app
- And when that was fixed and it became buildable, it didn't work
- But now that is fixed
- Version in the App Store is still 21.11
- Will be upgraded to 22.05 soon

Example of Improvements Needed

- **Keyboard handling**
 - Without a hardware keyboard, the on-screen keyboard is too eager to show up
 - When using the on-screen keyboard, the expected predictive suggestions don't show up

Thanks !
